Subject: Replacing the routing bot – yes, but not against the 90% test

The decision

Yes, you can switch the bot off. But not by copying its labels. Those labels match where requests actually ended up only **77%** of the time. About 1 request in 4 goes to the wrong team first, and that has not improved in any quarter. A system trained to copy the labels can score 95% on "match the labels" and still repeat the same mistakes. So I built the replacement to predict where a request really ends up (the team that closes it), and measured it on that.

The number

On 6,500 past requests it had not seen (tested forward in time, quarter by quarter), the new router picks the right team **84% of the time, against 77% for the bot**. When it is confident (86% of requests) it is right **94%** of the time. The remaining 14% are messages like "please call me about my purifier". Nobody, human or software, can tell where those go without asking; our best guess is right about 1 time in 5. For these the tool says "ask the customer" and sends them to a small triage desk (about 100 a month) instead of guessing.

The rupees (yearly, from your own 15 months of data)

	Wrong-team cost	Licence	Total	Saving vs today
Today (bot)	Rs 13.8 lakh	Rs 3.2 lakh	**Rs 17.0 lakh**	–
New router, routes everything	Rs 9.8 lakh	–	**Rs 9.8 lakh**	**Rs 7.3 lakh**
New router + triage desk	Rs 3.0 lakh + Rs 3.2 lakh desk	–	**Rs 6.2 lakh**	**Rs 10.8 lakh**

Each wrong-team request costs about Rs 700 (1.4 transfers at Rs 305, plus Rs 260 for the extra customer contact). The triage row assumes a call-back costs Rs 260; it still wins as long as one costs under about Rs 540. **For Farhan:** there is no per-request charge, because it uses no paid AI service. The only running cost is hosting a small server. I estimate a couple of thousand rupees a month but have not priced it, so please get a quote from Tanmay before switching. These are estimates, not guarantees.

What to do next week

1. **Run it in shadow mode for 2 to 4 weeks.** It suggests a team for every request while the bot keeps routing. Switch the bot off only if the 84% and 94% hold on live requests.
2. **Ask Meenal to set up a triage desk** of one or two people for the roughly 100 vague requests a month.
3. **Change the first question** in IVR, chat and WhatsApp to "what is wrong, in one line?". I expect this to shrink the vague pile, but I have not tested it.
4. **Plan headcount on where requests really end up**, not on the bot's labels: Repairs 23%, Installs & Demo 15%, Returns & Replacement 14%, Product Advice 13%, Warranty Claims 13%, Billing 12%, Filters & Consumables 10%. The bot over-sends to Repairs, Billing and Filters.
